TICKETING SERVICE FLOW

This proposal presents a comprehensive solution for building a **Web Portal** and **Mobile Application** to streamline customer support, ticketing workflows, and employee task management.

INTRODUCTION

The solution aims to:

- Provide **centralized customer master data management**.
- Ensure **efficient ticket creation, tracking, resolution, and escalation**.
- Deliver a **seamless experience across portal and mobile app** for customers, employees, and management.

The Objective

The proposed solution aims to deliver a **unified digital platform** in the form of a **Web Portal** and a **Mobile Application** that together will cover three critical business needs.

- **Customer Master Data Management** – maintain accurate and centralized customer information.
- **Ticketing Service Workflow** – ensure customer issues are logged, tracked, resolved, and escalated within SLA.
- **Mobile Access** – customers and employees can interact with the system via mobile app.
- **Task Manager Tracker** – enable employee task visibility, allocation, and productivity insights. (Future proposal)

This will streamline operations, reduce manual intervention, improve SLA compliance, and enhance overall customer and employee experience.

MODULES & FEATURES

A. Company Module

Customer Master Data Management

- Capture detailed customer information (Name, Email, Address, Mobile No., GSTN, etc.) in a structured manner.
- Allow linking of **multiple email IDs** to one customer record for accurate communication.
- There should be an option to add **alternate contact person details**, along with Active/Inactive status functionality.

Add/Update Company

- Provide a **simple form interface** for manual additions and updates.
- Enable **bulk upload** (Excel import) of customer and employee data, reducing manual entry effort.

Future-readiness

- A **Project Manager role/module** is built into the system but **will remain disabled until required**. This ensures the system can easily scale without redevelopment.

Fields For Company Module

- Company Name (Add – Text Field)
- Address (Add – Text Field)
- GSTN (Add – Text Field)
- Primary Email ID (Add – Text Field)
- Alternate Email IDs (Add – Multiple Field)
- Contact Person Name (Add – Text Field)- (Active / Inactive options)
- Contact Person Phone (Add – Number Field)
- Contact Person Address (Add – Text Field)
- Alternate Contact person with Phone , Address, Email (Add – Text Field)

B. Ticketing Service Module

The Ticketing Service module enables customers to raise issues and ensures efficient tracking, escalation, and closure.

Workflow & Assignment:

- Tickets will follow a **role-based hierarchy (L1 → L2 → L3)**.
- Assignment can be done either **automatically** (based on employees' availability/free slots) or **manually** via **portal**.
- All tickets in the portal will be created at **L1 level** and assigned to the **L1 employee who creates the ticket**.
- Balanced workload distribution ensures timely responses.

Ticket Life Cycle:

- **Ticket Creation**
 - Auto Ticket creation from incoming **email subject lines**.
 - Manual Ticket creation from **phone calls via portal**.
 - Every ticket gets a **unique Ticket ID**.
- **Ticket creation flow**
 - Ticket can be created automatically from the email subject line.
 - Ticket will be auto-assigned to an employee based on free slot or availability.
 - Ticket can also be created manually through the portal.
 - System will generate a unique Ticket ID for each ticket.
 - Customer will receive a notification after ticket creation.
 - Employees of **L1** always create manual ticket on portal and try to resolve the issue.
- **Manual Ticket creation fields**
 - Customer name – (Select from Drop down) OR (+) Add option for new customer
 - Customer details – (Auto fetch)
 - Problem type – (Drop down – predefined from Email subject line) And (Text field for new problem)
 - Priority – (drop down- High / Medium/ Low)
 - Ticket Category – (Drop Down- Free/ Paid)
 - Created by- Name from L1 employee data (Drop down)
- **Acknowledgment**
 - Customer receives acknowledgment through WhatsApp message.
- **Ticket Management**
 - Limit of **2 open tickets per customer** at a time, new tickets restricted until existing ones are resolved to avoid overload.
 - Ticket priority can be set (Low/Medium/High).
 - Resolution timer starts when employee opens the ticket.
- **Closure**
 - Auto ticket creation - Tickets can only be closed by customer after providing feedback (remarks + rating).

- Manual ticket creation – A ticket can be closed by the Customer and the Manager after mutual discussion. If the customer does not respond or fails to close the ticket, the Manager must review and close the ticket from his end once satisfied with the resolution process.
- **Escalation Management**
 - Tickets will be **escalated manually with proper reason** to another capable employee.
 - Tickets escalate through hierarchy (L1 → L2 → L3) or to agent / parent company with reason.
 - **Escalation trail** maintained with timestamps, notes, and full history.
 - Escalation logic:
 - Resolved → move to closure
 - Unresolved → escalate to next level.

Ticket Workflow For solving problem

- Select customer → auto-fetch master data./ Input
- Customer details → auto fetch
- Select problem type → dropdown (Predefined from Email subject line) And (Text field for new problem)
- Define priority → Dropdown (High / Medium / Low)
- Escalated to → Dropdown (L1 / L2 /L3)
- Escalation reason → Text field
- Resolution timer → Starts and continue from L1→L2→L3.
- Timer Stopped → once resolved (track time , history of resolution time at each level)
- Employee resolves → Mark as complete .
- Manager reviews & approves closure.
- Mandatory approval ensures tickets are not closed without oversight.
- Ticket Closed by Customer and Management .(Both side Clouser)

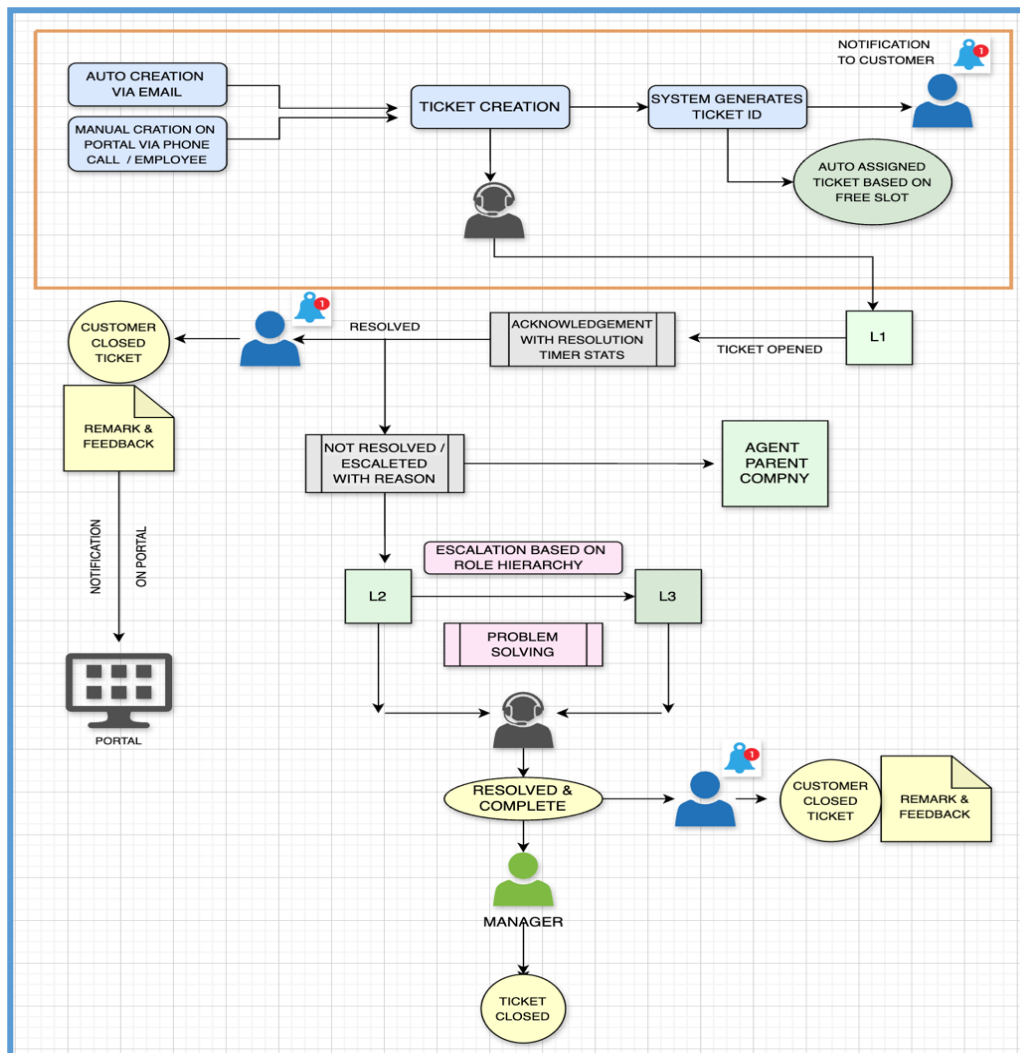

Fields For Ticket Module

- Ticket ID (**Auto-generated**)
- Customer Name (**Auto-populated from Company Master/ Input**)
- Customer Details (**Auto populated**)
- Problem Type (**Dropdown/ Input**) - (Predefined from Email subject line) And (Text field for new problem)
- Allocated to / Created by / Employee (**Drop down - Employee list**)
- Priority (**Dropdown: Low/Medium/High**)
- Assigned Level (**Manually selected : L1/L2/L3**)
- **Resolution Timer** – Starts at **L1** and continues across **L2 → L3** until resolved.
- **Timer Stopped** → once resolved (track time , history of resolution time at each level)

- Escalation Level (**Manually selected from dropdown - Hierarchy- L1/L2/L3/ Agent/ Parent Company**)
- Escalation reason (**Text field**)
- Status (**Dropdown: Open/In Progress/Resolved/Closed**)
- Feedback (**Remarks + Rating Dropdown**)
- Attachment – **Multiple attachment** (Size -discuss later)

Stage	Process Step	Details / Actions
1	Ticket Creation	Tickets can originate automatically (via email subject lines) or manually (via portal or phone call entry).
2	Ticket ID Generation	System assigns a unique Ticket ID to every new ticket. Notification sent to customer.
3	Priority Definition	Priority (Low / Medium / High) selected to drive SLA timers .
4	Open Ticket Limit Check	Restricts customers to 2 open tickets; prevents system overload.
5	Assignment	Tickets can be assigned automatically based on employee availability.
6	Resolution Timer	Starts once the engineer opens the ticket to begin tracking response and resolution duration.
7	Work Execution	Employee updates progress, notes, and attachments in the system.
8	Escalation	If SLA unresolved, escalates to next hierarchy (L2 → L3) or agent / parent company with proper reason.
9	Manager Review	Once resolved, the manager verifies and approves closure to ensure oversight.
10	Customer Feedback	Ticket sent to customer for closure feedback — includes remarks and rating.
11	Closure	Tickets are closed by customer as well as management only after receiving customer feedback and rating.

Workflow Diagram – Ticket Life Cycle

C. Task Manager Tracker (For future implementation)

- **Employee Task Tracking**
 - Record tasks assigned to employees.
 - Track progress with status: Pending / In-Progress / Completed.
 - Provides clarity of work distribution and accountability
-
- **Auto-Generated Task Management**
 - **Auto-suggests or allocates tasks** based on workload and priorities.
 - Identifies **bottlenecks** and recommends distribution of tasks.
 - Provides **performance insights** for continuous improvement

Mobile Application Proposal For Customer & Employee

Mobile App Support:

- **Customers:** Raise, track, and close tickets directly from mobile app.
- **Employee:** Accept assignments, update ticket status, resolve tickets.

Customer Mobile Application Features

- Customers can **create tickets** from the app.
- **Ticket ID** will be generated automatically.
- Customers can **view ticket status** (Open / closed)
- Receive **notification** when resolution process starts.
- Receive **WhatsApp message** when process starts.
- Receive **notification and WhatsApp message** when ticket is resolved.

Employee Mobile Application Features

- Employees can **create tasks** from the app.
- Receive **task notifications** for new or updated tasks.
- **Check-in** and **Check-out** option with time and location capture.
- **Location service** to track visit place and timing. (Optional)
- **Task management** – view, update, and close assigned tasks.
- Dashboard to see daily assigned and completed tasks.

BENEFITS

For Customers

- Quick, SLA-driven support.
- Transparent escalation with full visibility.
- Mobile-first approach for raising and tracking tickets.

For Employees

- Optimized workload with auto-assignment.
- Clear task tracking prevents duplication.
- Real-time mobile updates for tickets and tasks.

For Management

- Centralized customer & ticket data for governance.

- Real-time SLA and escalation compliance reports.

Phase	Deliverables
Phase 1	Company Master Module + Data Upload (Portal)
Phase 2	Ticketing Service Integration (Portal + Mobile App ticket creation/tracking)
Phase 3	Escalation & Approval Workflow Implementation
Phase 4	Mobile App Enhancements (Push notifications, offline sync, advanced features)

FUTURE SCOPE

- **CRM/ERP Integration**
 - Bi-directional integration with ERP/CRM platforms for seamless data flow across business systems.
- **Mobile App for Customers & Employees**
 - Employees can manage tasks, accept assignments, and update status on the go.
- **Predictive Analytics**
 - Use historical ticket and task data to predict issues before they occur.
 - Enable **proactive support** to reduce downtime and improve customer satisfaction.

DELIVERABLES

- Fully functional **Web Portal** (responsive, role-based access).
- **Mobile Apps** (Android & iOS).
- Admin & User documentation.
- Post-deployment support & maintenance.
